

AUTOMATIC TRANSFER SWITCH CONTROL

ATS 1.X

DESCRIPTION

ATS 1.1 automatic transfer unit is a microprocessor based digital unit monitoring the 3 phases of the mains and controls the changeover of mains and generator contactors if a mains failure on any phase is detected. The module offers a very cost effective and space saving solutions as it is able to display all the parameters which are essential for the basic genset transfer control. The module has 3 operation modes. Test on load, test off load and Auto operation modes can be chosen via the push-buttons mounted on the front panel. The 39 (29 parameters on ATS1.0) parameter settings can also be adjusted from the front panel. So the module can be adapted to all generators without the need of any other unit or module.

OPERATION PRINCIPLES

Monitoring and Indicators:

- L1-N mains voltage
- L2-N mains voltage
- L3-N mains voltage
- L12, L23, L31 mains voltage
- L1-N generator voltage
- Generator and Mains frequency
- By pressing the menu button, parameters can be displayed on the unit.
- All the status indicators on the front panel

Operation modes:

Test On Load

This is used to manually start and run the engine on load.

Auto

The Auto button is used for automatic mode of operation. If a mains failure on any phase is detected, the load is switched off from the mains and the ATS unit automatically will issue a start command to the genset controller by using the parameters settings which are adjusted before. When the generator operates within the limits adjusted before, the load is transferred to the generator by the ATS module. When the mains supply has been restored, the ATS module will transfer the load back from the generator to the mains supply and issue a stop command to the genset controller. In case of a failure while operating, the unit will stop the generator automatically. A clear mimic diagram and LEDs provide information about the load status and voltages.

Test Off Load

This is used to manually start and run the engine off load. If the mains supply fails, then the load is transferred to the generator automatically.
